Questions to meet the OMB objective

1. Reducing emissions

- How much planned capital spending is rated aligned with greenhouse gas mitigation, and what share of the total is that? (`ghg_mitigation`, `fiscal_year_amount`). Answerable.
- Which asset categories and budget lines hold the most spending that is not aligned for emissions? (`asset_category`, `budget_line`). Answerable.

2. Enhancing air quality

- How much planned funding goes to projects with an air-quality benefit, once “AQ” and “Air Quality” are merged? (`environmental_and_social_benefits`). Answerable after cleaning.
- Is that funding also emissions-aligned, or do some projects deliver one benefit but not the other? (benefits and `ghg_mitigation`). Answerable.

3. Heat resiliency

- How much funding is heat-resiliency aligned, and how much of the total does it represent? (`heat_resiliency`). Answerable.
- Is heat-resilience funding going to high-heat areas? That is, how much funding in high-heat areas is rated aligned, and how much is not? (`heat_vulnerability_index`, `heat_resiliency`). Answerable.

4. Flood resiliency

- The same two questions as heat, using `flood_resiliency` and `flood_vulnerability_index`. Answerable.

5. Environmental justice for communities of color

- How much funding carries the closest social benefits: Access to Resources, Access to Safe & Healthy Housing, Exposure to Hazardous Materials? Partly answerable, because these are social benefits and not equity measures.
- How much funding lands in areas that are both high-heat and high-flood? Partly answerable, as an exposure proxy.
- Does funding reach communities of color? Not answerable from this dataset, because there is no demographic or neighbourhood column. State this as a limitation. It would need a join to census or equity data, which you can name as future work.

6. Whether the data guides investment (the “data that guide us” part)

- How much planned spending is still awaiting a climate rating, so it can’t yet guide decisions? (pending values, `project_id`). Answerable.
- How did the climate-aligned share change across the FY2025, FY2026 and FY2027 plans? (`financial_plan`, `first_fiscal_year`). Answerable, compared by edition. Don’t sum

across editions.
- Are the budget lines with the largest funding the ones with the strongest alignment, or the weakest? (`budget_line`). Answerable.

For the assignment

Your current five questions already cover the first, third, fourth and sixth groups. The two gaps are air quality and environmental justice. I'd suggest one air-quality question and one proxy-based justice question, which gives a final set of about six, since the report is only 1,250 words. I'd note the demographic gap as a limitation.

Tell me if you'd like me to rewrite the problem statement and business questions to match the six.

Could you summarise the questions concisely to a one line sentences?

- How much planned spending is rated aligned with emissions reduction, and what share of the total is that?
- Which asset categories and budget lines hold the most spending that is not emissions-aligned?
- How much planned funding goes to projects with an air-quality benefit?
- How much funding is heat-resiliency aligned, and is it reaching high-heat areas?
- How much funding is flood-resiliency aligned, and is it reaching high-flood areas?
- How much funding carries the closest social benefits, such as Access to Resources, healthy housing and hazardous-material exposure?
- How much funding falls in areas that are both high-heat and high-flood?
- How much planned spending is still awaiting a climate rating?
- How did the climate-aligned share change across the FY2025, FY2026 and FY2027 plans?
- Does funding reach communities of color? The dataset can't answer this, so state it as a limitation.
